INFORMATION DISCLOSURE STATEMENT

Mail Stop Patent Application
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Dear Sir:

This Information Disclosure Statement is being submitted in connection with the above-identified application for patent. Applicants submit herewith patents, publications or other information of which they are aware, which they believe may be material to the patentability of this application and in respect of which there may be a duty to disclose in accordance with 37 C.F.R. § 1.56.

While this Information Disclosure Statement may be "material" pursuant to 37 C.F.R. § 1.56, it is not intended to constitute an admission that any patent, publication or other information referred to herein is "prior art" for this invention unless specifically designated as such.

In accordance with 37 C.F.R. § 1.97(g), the filing of this Information Disclosure Statement shall not be construed to mean that a search has been made or that no other material information as defined in 37 C.F.R. § 1.56(a) exists.

The attached form, PTO-1449, provides a listing of patents, publications, or other information as required by 37 C.F.R. § 1.98(a)(1).

A copy of each of the items identified on the attached Form PTO-1449 is supplied herewith, except for the U.S. Patents and the pending patent applications, for which no copies are being submitted.

Respectfully submitted,

WINSTEAD SECHREST & MINICK P.C.

Flash Lock Out

Disclosed is a means to prevent unauthorized code from changing the contents of Flash memory. At power-up, software in the Flash updates the Flash memory if needed, then locks Flash using a hardware-supplied register bit.

PowerPC* systems use Flash memory to store the boot code, some system vital product data, and power-on self test. Flash memory is writable; this is desirable so that field upgrades to Flash may be made without physically changing the part. However, Flash is exposed, and errant code could overwrite the memory and destroy the system's ability to boot up and run.

This exposure is eliminated on PowerPC systems as follows:

- The Flash comes up in an open (writable) state.
- During power-on, software in the Flash checks to see if a Flash update is required. A key sequence or special record on the boot media may indicate that an upgrade is called for.
- If an upgrade is needed, then the upgrade boot occurs and Flash is rewritten.
- The PowerPC system hardware supplies a register bit which powers on to a reset condition. When this register bit is written to 1, it cannot be reset except with a power-off-and-on.
- After a Flash upgrade, or after it is determined that no Flash upgrade cycle is needed, the software sets the lockout register bit, thus locking the Flash.

The system is now safe from any accidental rewrites of Flash memory. Write cycles to Flash while it is locked will be ignored.
